## Class 27: Past and Present Climate Change (continued)

- The Baseline: Past Climate Changes
- The Syndrome: Recent Climate and Global Change
- The Diagnosis: Leaving the “Safe Operating Space”
- The Prognosis: Journey Into the Unknown
- The Therapy: “Lifestyle” changes

# The Therapy: “Life-Style” Changes

How did we get here?

Adam Smith et al.: Purpose of economy is to create human wealth

Today: Purpose of economy is growth

Earth: Our Life-Support System

Economy is between us and the Life-Support System

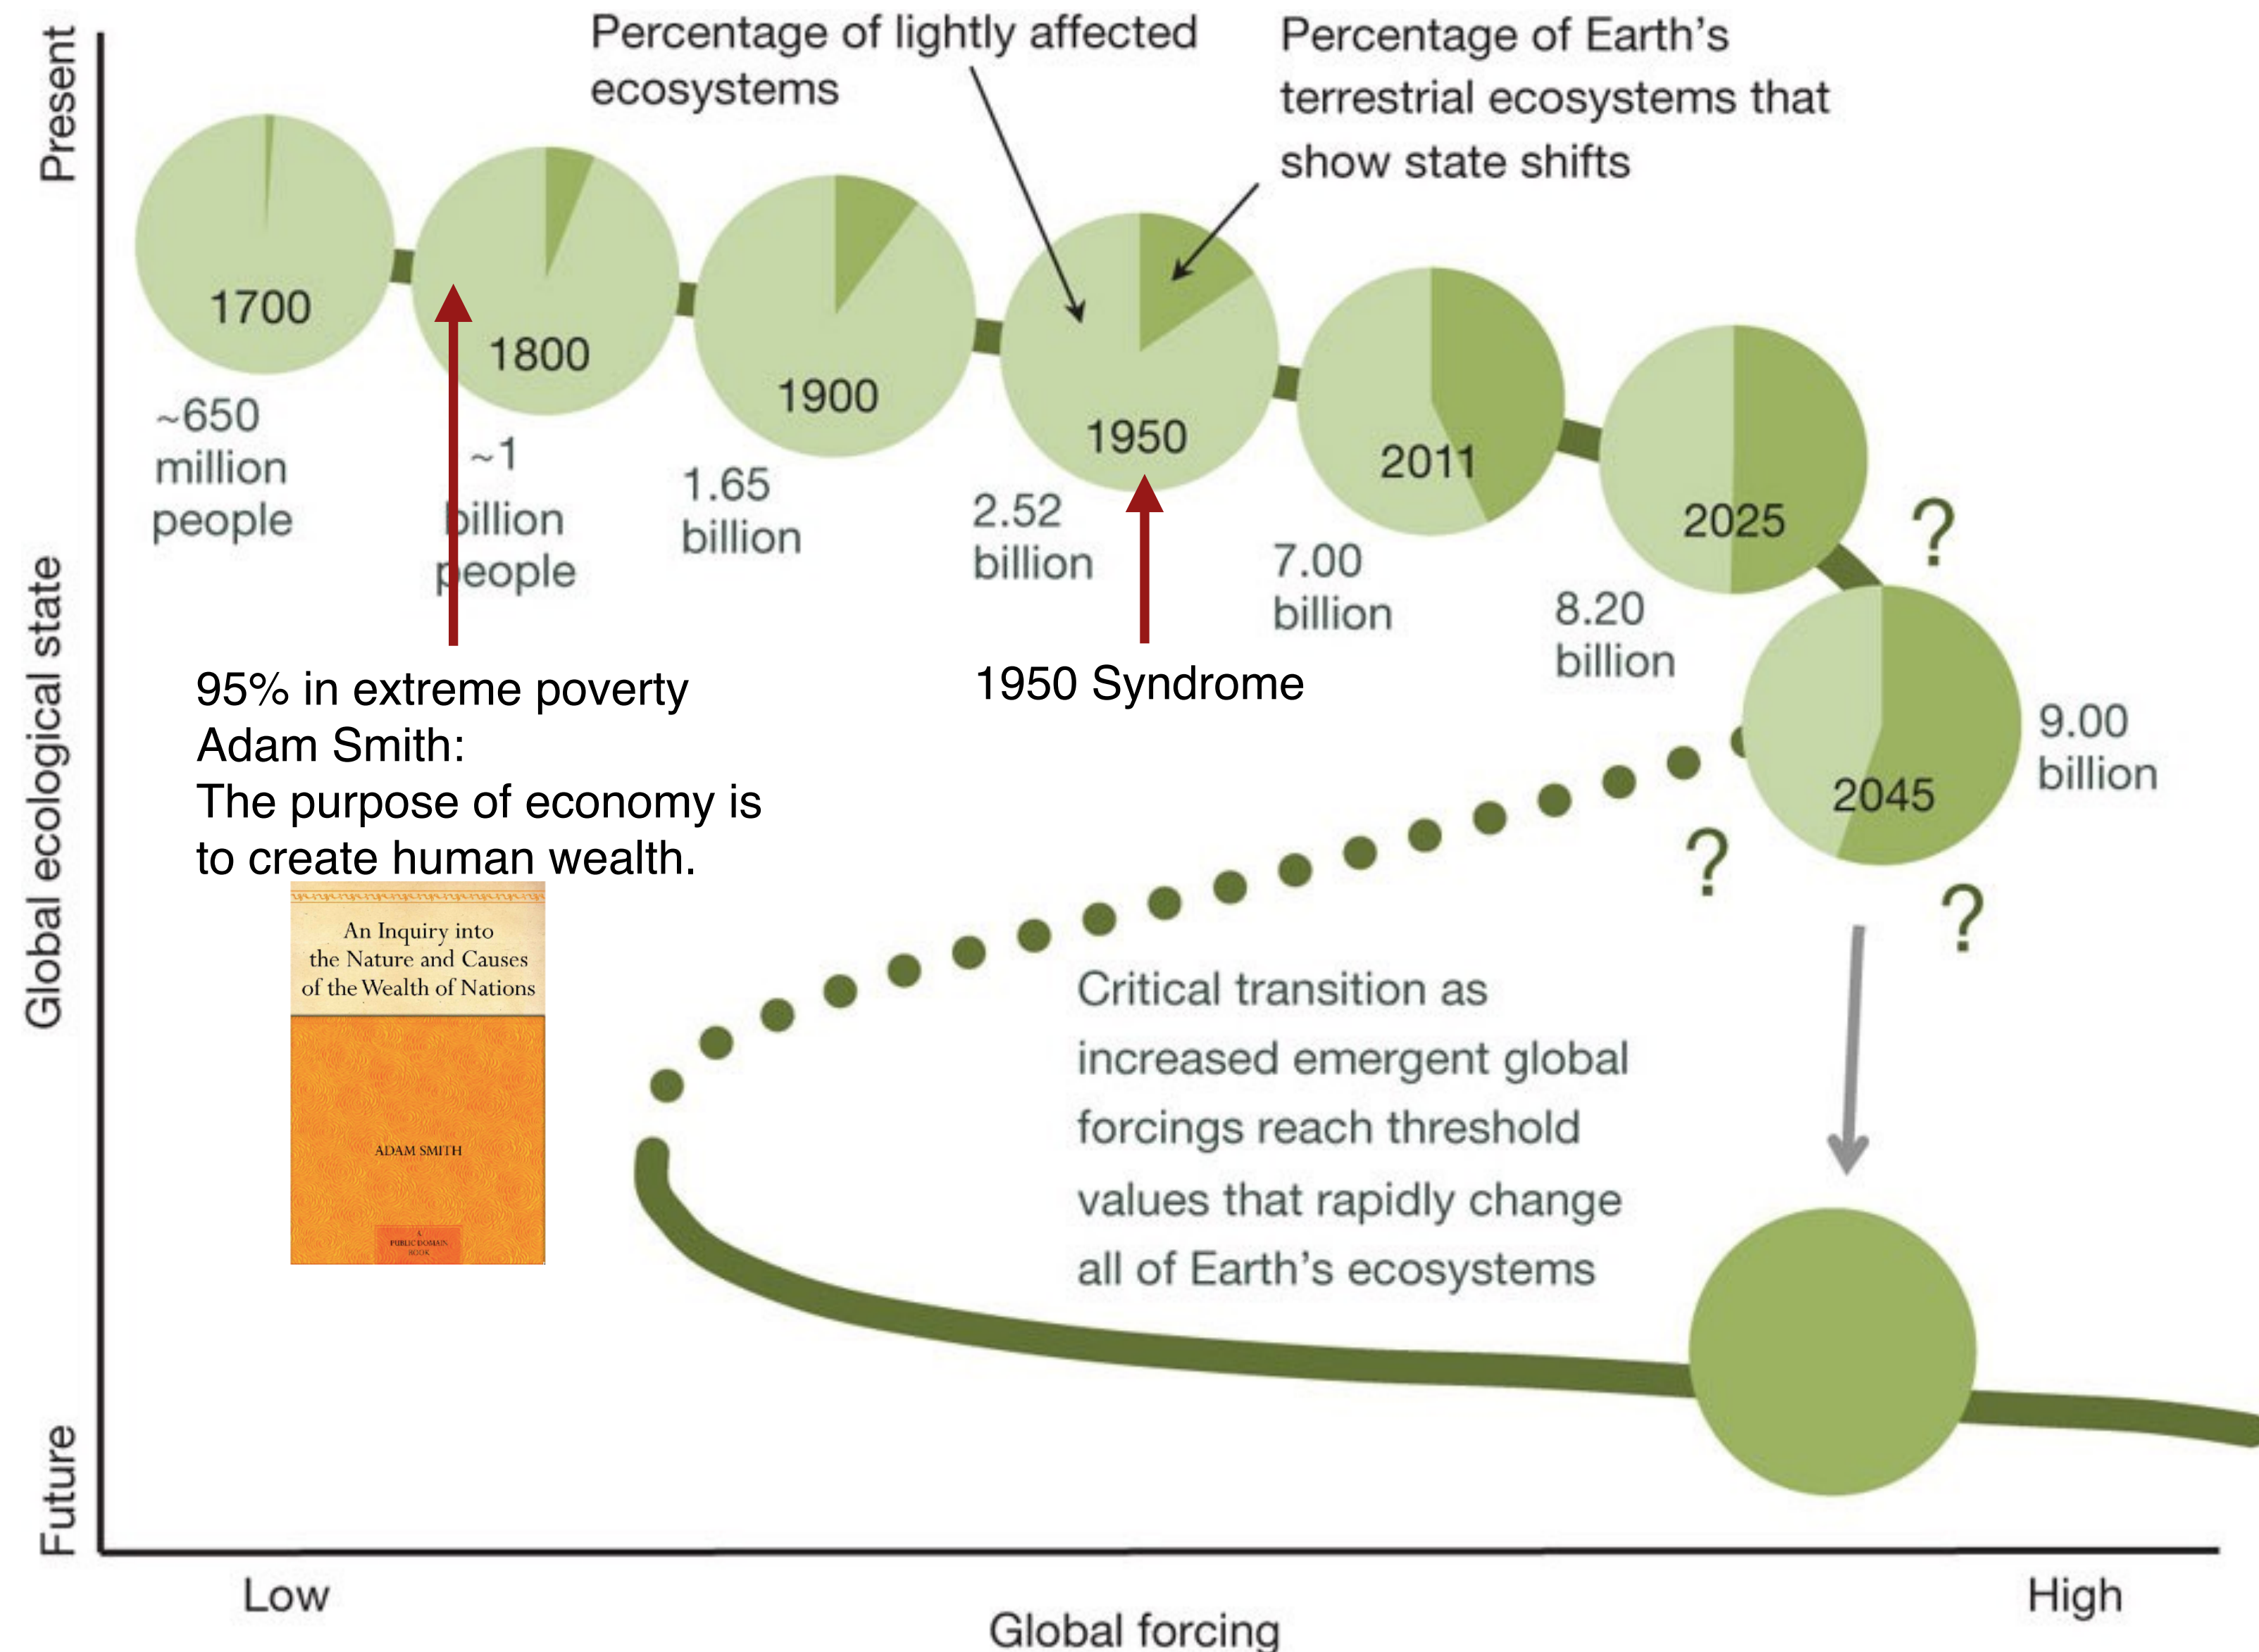

Everything is about Flow

Flows are regulated by ethical and social norms and economic rules

# The Therapy: “Life-Style” Changes

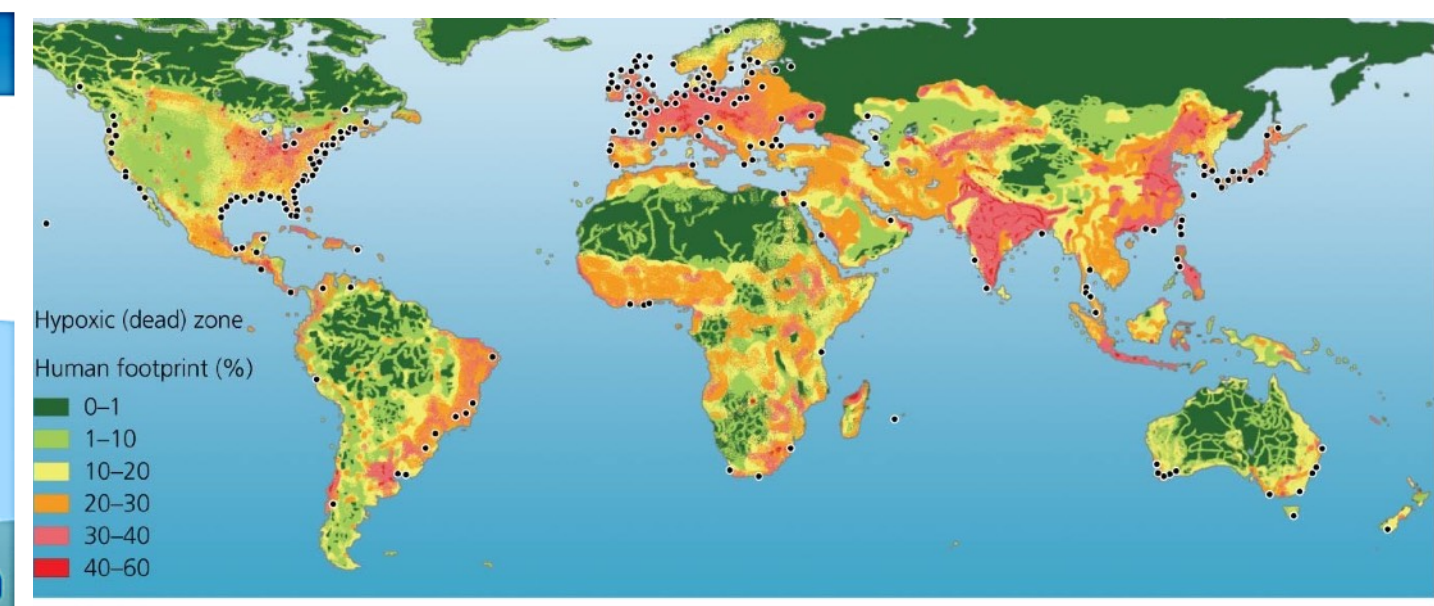

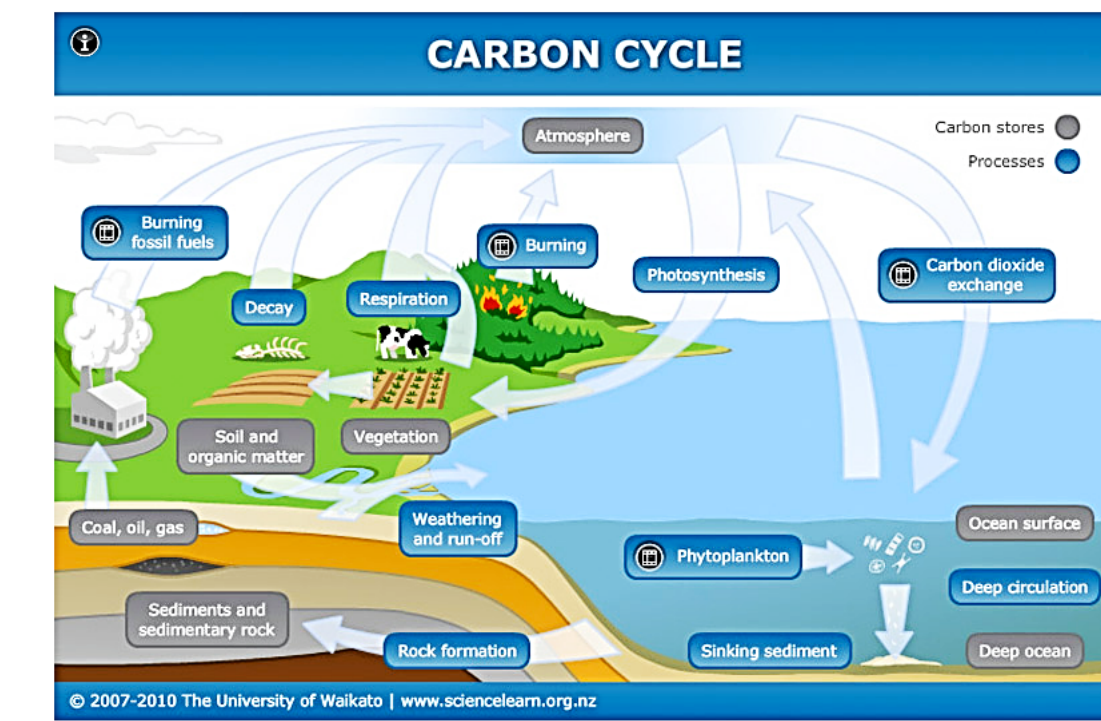

Humanity has been extremely successful as a species on this planet in changing the planet  
We are the operators of Earth's life-support system

# The Therapy: “Life-Style” Changes

We are heading for a planet without other large mammals - only sapiens left.

Rockstrom and Klum, 2015

We are rapidly reengineering the planet without a clear strategy, a design consideration, a plan

We are the operators of Earth’s life-support system

We have an issue ...

Leaving the Holocene:

- a uniquely stable period in the history of the Earth's life support system,
- very beneficial for humans to develop civilization

We have an issue ...

Leaving the Holocene:

- a uniquely stable period in the history of the Earth's life support system,
- very beneficial for humans to develop civilization

We have entered a (brief?) period of our making: the Anthropocene

We have an issue ...

Leaving the Holocene:

- a uniquely stable period in the history of the Earth's life support system,
- very beneficial for humans to develop civilization

We have entered a (brief?) period of our making: the Anthropocene

Humanity is operating the planetary system and determining the future of the planet

We are rapidly reengineering the planet without a clear strategy, a design consideration, a plan

We have an issue ...

Leaving the Holocene:

- a uniquely stable period in the history of the Earth's life support system,
- very beneficial for humans to develop civilization

We have entered a (brief?) period of our making: the Anthropocene

Humanity is operating the planetary system and determining the future of the planet

We are rapidly reengineering the planet without a clear strategy, a design consideration, a plan

Knowing the flows is fundamental for doing a good job

We are the operators of Earth’s life-support system  
Our leaders are the pilots of spaceship Earth

# The Therapy: “Life-Style” Changes

The Earth keeps changing and we keep changing the Earth

We are the operators of Earth's life-support system  
Our leaders are the pilots of spaceship Earth

# The Therapy: “Life-Style” Changes

The Earth keeps changing and we keep changing the Earth  
Our system knowledge increases

We are the operators of Earth’s life-support system  
Our leaders are the pilots of spaceship Earth

# The Therapy: “Life-Style” Changes

The Earth keeps changing and we keep changing the Earth

Our system knowledge increases

For the first time, we can see the control levers,  
knobs and switches that drive the Earth system

We are the operators of Earth’s life-support system  
Our leaders are the pilots of spaceship Earth

# The Therapy: “Life-Style” Changes

The Earth keeps changing and we keep changing the Earth

Our system knowledge increases

For the first time, we can see the control levers,  
knobs and switches that drive the Earth system

But we don't have the control panel, the cockpit  
to control and operate the system

We are the operators of Earth's life-support system  
Our leaders are the pilots of spaceship Earth

# The Therapy: “Life-Style” Changes

The Earth keeps changing and we keep changing the Earth

Our system knowledge increases

For the first time, we can see the control levers, knobs and switches that drive the Earth system

But we don't have the control panel, the cockpit to control and operate the system

Plag, 2000

We are the operators of Earth's life-support system  
Our leaders are the pilots of spaceship Earth

# The Therapy: “Life-Style” Changes

The Earth keeps changing and we keep changing the Earth

Our system knowledge increases

For the first time, we can see the control levers, knobs and switches that drive the Earth system

But we don't have the control panel, the cockpit to control and operate the system

We are the operators of Earth's life-support system  
Our leaders are the pilots of spaceship Earth

# The Therapy: “Life-Style” Changes

“Sustainable Development is a development that meets the needs of the present while safeguarding Earth’s life support systems, on which the welfare of current and future generations depends.” (Griggs et al., 2013)

Our connection to the Earth’s Life-Support System is economic in nature: Economy controls the flows between the life-support system and us.

# The Therapy: “Life-Style” Changes

“Sustainable Development is a development that meets the needs of the present while safeguarding Earth’s life support systems, on which the welfare of current and future generations depends.” (Griggs et al., 2013)

Our connection to the Earth’s Life-Support System is economic in nature: Economy controls the flows between the life-support system and us.

**Economy for humanity:**

“An economy that meets the needs of the present while safeguarding Earth’s life-support system, on which the welfare of current and future generations depends.”

*Jules-Plag and Plag, 2013*

The Pledge: I will carry out economic activities with the goal to meet the needs of the present while safeguarding Earth's life-support systems, on which the welfare of current and future generations depends.

Our Vision: Facilitating the great transition from the present “Economy Against Humanity” to an “Economy for Humanity” that “meets the needs of the present while safeguarding Earth's life-support system, on which the welfare of current and future generations depends.”

“Somehow, we have come to think the whole purpose of the economy is to grow, yet growth is not a goal or purpose. The pursuit of endless growth is suicidal.” David Suzuki

Transition towards an economy that “meets the needs of the present, while safe-guarding the Earth’s life-support system, on which the welfare of current and future generations (of human and non-human animals) depends.”

# Key Points

## Baseline

During the Holocene, climate and sea level were exceptionally stable

The Holocene was a “safe operating space for humanity”

## Syndrome

During the last hundred years, humanity has introduced rapid and large changes

The system is outside the “normal range” and in the dynamic transition into the Post-Holocene; we have increasing disequilibrium

## Diagnosis

Easy access to seemingly unlimited energy allowed humans to accelerate flows in the Earth’s life-support system and sustain rapid population growth and increasing demands

Humans are the “Anthropogenic Cataclysmic Virus” (ACV) in the Earth’s life-support system

## Prognosis

We are heading rapidly into a very different system state (thresholds; Post-Holocene)

Our knowledge is changing rapidly; there is room for surprises; Foresight is needed

## Therapy

Change in the purpose of economy from growing human wealth (growth addiction) to “meeting our needs while safe-guarding the life-support system”

“No problem can be solved with the same consciousness that created it.”  
*Albert Einstein*

“It is difficult to get a man to understand something when his job depends on not understanding it”  
*Upton Sinclair*

- Wildfires

# Natural Hazards and Disaster

## Class 27: Climate Change Impacts

- Sea Level Rise
- Heat Waves
- Droughts
- Cold Spells
- Wildfires

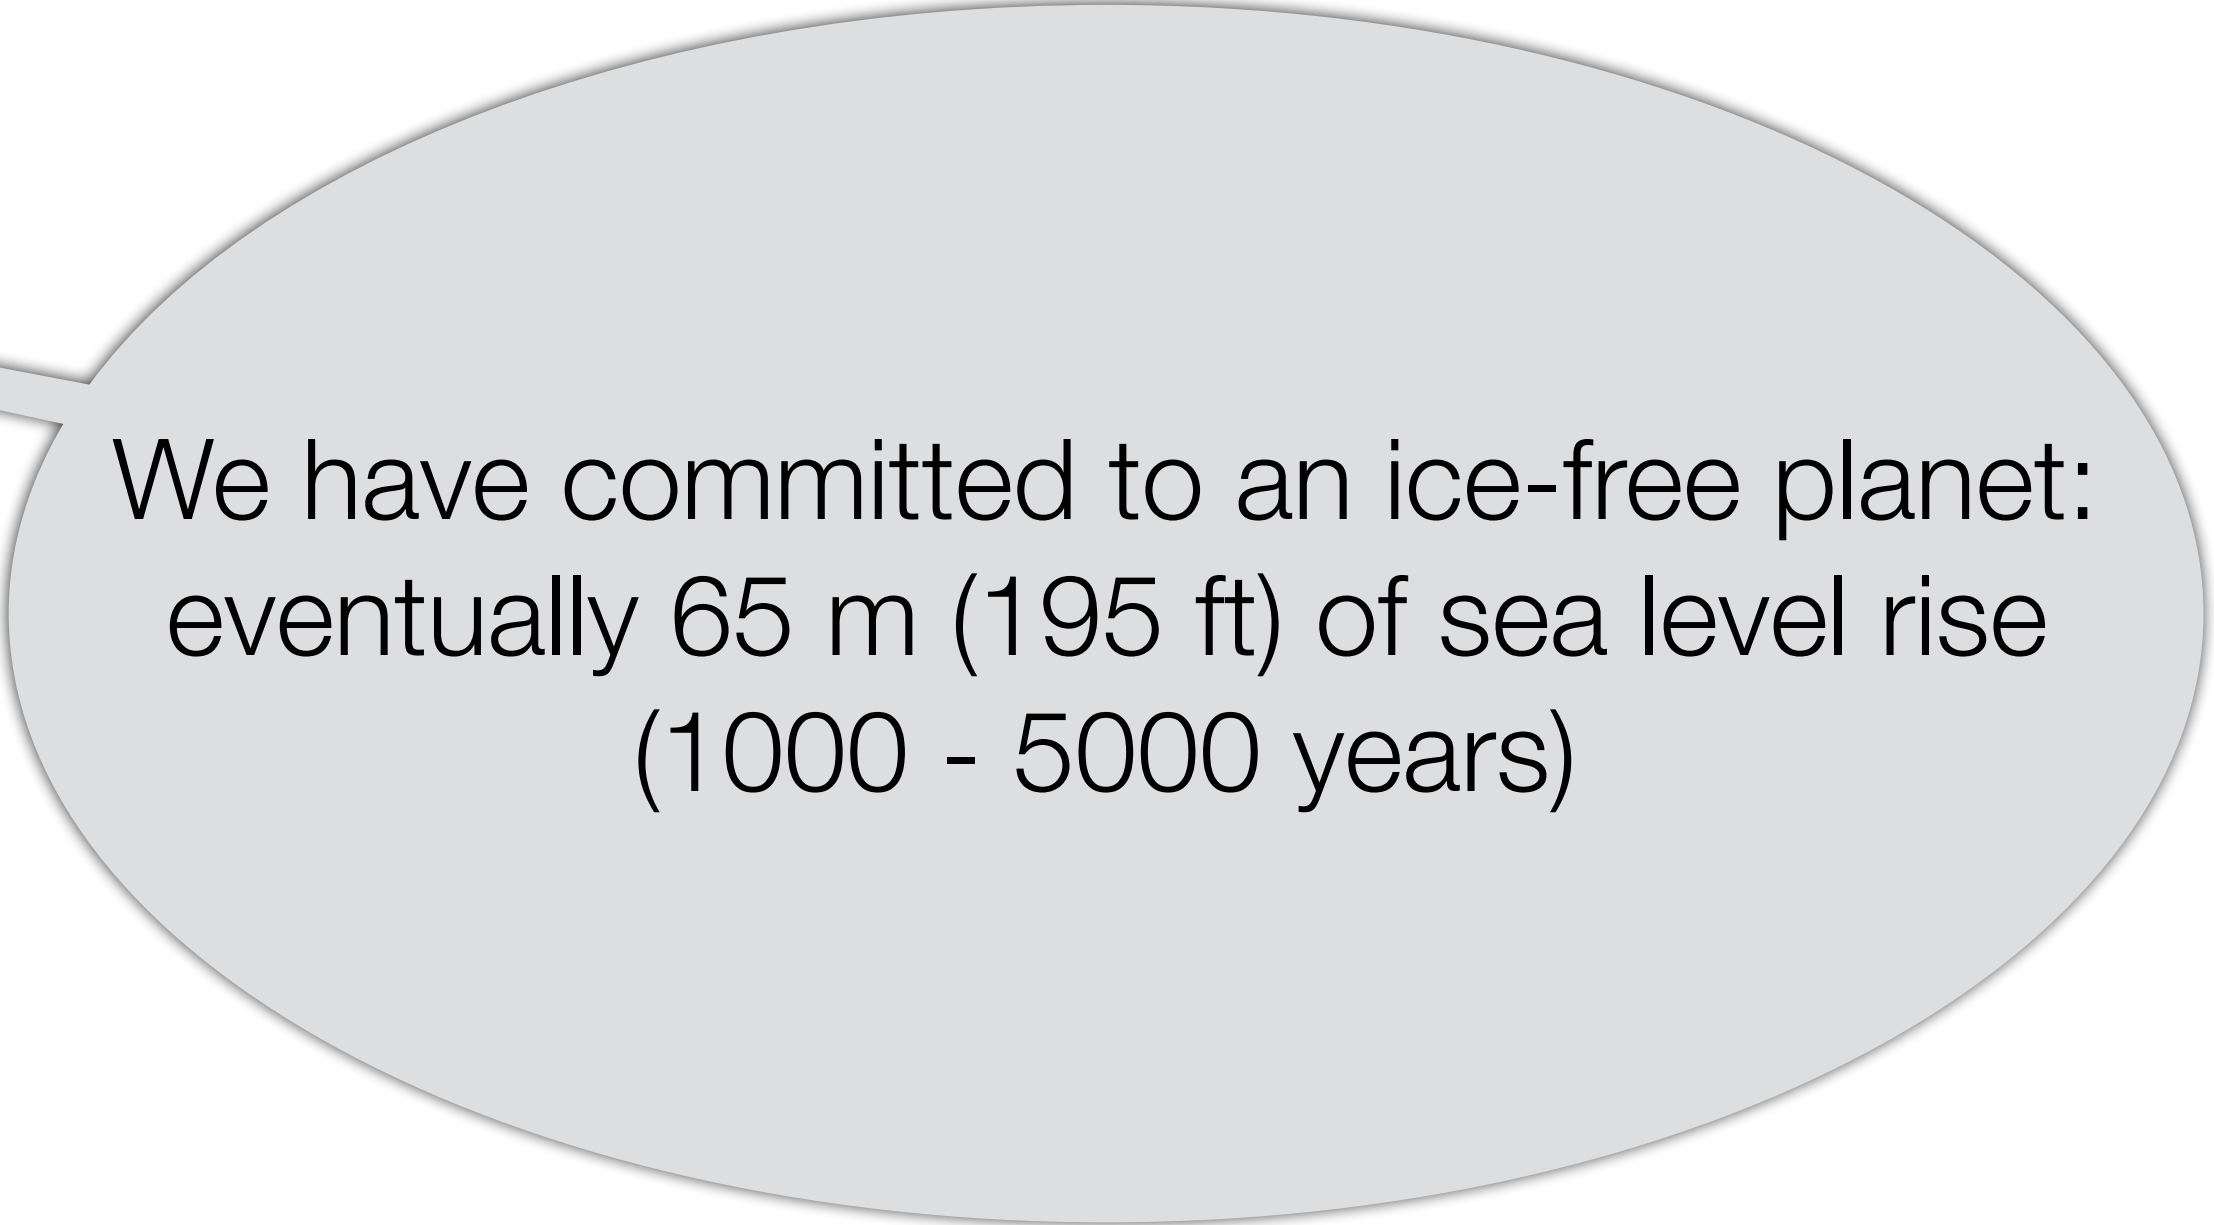

## Longer-term:

- 1°C corresponds to about 25 m in sea level
- Expect large sea level rise over several centuries (several meters to >20 m)
- Horizontal migration of coasts
- Pollution of inundated coastal areas and waters
- Prepare for loss of coastal cities

## Longer-term:

- 1°C corresponds to about 25 m in sea level
- Expect large sea level rise over several centuries (several meters to >20 m)
- Horizontal migration of coasts
- Pollution of inundated coastal areas and waters
- Prepare for loss of coastal cities

A light gray oval callout bubble with a thin black border. A line extends from the left side of the bubble, pointing towards the list of longer-term impacts. The text inside the bubble is centered and reads: 'We have committed to an ice-free planet: eventually 65 m (195 ft) of sea level rise (1000 - 5000 years)'.

We have committed to an ice-free planet:  
eventually 65 m (195 ft) of sea level rise  
(1000 - 5000 years)

# Sea Level Rise

## Longer-term:

- 1°C corresponds to about 25 m in sea level
- Expect large sea level rise over several centuries (several meters to >20 m)
- Horizontal migration of coasts
- Pollution of inundated coastal areas and waters
- Prepare for loss of coastal cities

We have committed to an ice-free planet:  
eventually 65 m (195 ft) of sea level rise  
(1000 - 5000 years)

# Sea Level Rise

## Longer-term:

- 1°C corresponds to about 25 m in sea level
- Expect large sea level rise over several centuries (several meters to >20 m)
- Horizontal migration of coasts
- Pollution of inundated coastal areas and waters
- Prepare for loss of coastal cities

Eventually, protections will fail

# Sea Level Rise

## Longer-term:

- 1°C corresponds to about 25 m in sea level
- Expect large sea level rise over several centuries (several meters to >20 m)
- Horizontal migration of coasts
- Pollution of inundated coastal areas and waters
- Prepare for loss of coastal cities

Slowly divest in exposed coastal areas

# Sea Level Rise

## Longer-term:

- 1°C corresponds to about 25 m in sea level
- Expect large sea level rise over several centuries (several meters to >20 m)
- Horizontal migration of coasts
- Pollution of inundated coastal areas and waters
- Prepare for loss of coastal cities

Build mobile infrastructure  
and buildings

# Sea Level Rise

## Longer-term:

- 1°C corresponds to about 25 m in sea level
- Expect large sea level rise over several centuries (several meters to >20 m)
- Horizontal migration of coasts
- Pollution of inundated coastal areas and waters
- Prepare for loss of coastal cities

Clean up the coastal zone

# Sea Level Rise

## Longer-term:

- 1°C corresponds to about 25 m in sea level
- Expect large sea level rise over several centuries (several meters to >20 m)
- Horizontal migration of coasts
- Pollution of inundated coastal areas and waters
- Prepare for loss of coastal cities

This century

## Will a rising tide sink all homes?

Nationwide, almost 1.9 million homes (or roughly 2 percent of all U.S. homes) worth a combined \$882 billion are at risk of being underwater by 2100 if sea levels rise by six feet. Some states will be hit harder than others.

State	Number of Potentially Underwater Properties	Fraction of Total Housing Stock Underwater	Total Value of Potentially Underwater Properties
California	42,353	0.44%	\$49.2B
Texas	46,804	0.61%	\$12B
New York	96,708	2.10%	\$71B
Florida	934,411	12.56%	\$413B
Pennsylvania	2,661	0.06%	\$730M
Georgia	24,379	0.75%	\$10.2B
North Carolina	57,350	1.64%	\$20.6B
New Jersey	11,670	3.09%	\$3.6B

### Zillow study:

- 1.8 m by 2100
- 36 U.S. Coastal Cities lost;
- more than 50 cities lose at least 50% of residential real estate
- \$1 Trillion in loss (2% of residential real estate value)

Maine			\$3.1B
New Hampshire	4,064	0.71%	\$1.7B
Rhode Island	4,853	1.47%	\$2.9B
Delaware	11,670	3.09%	\$3.6B

# Sea Level Rise

Longer-term:

- 1°C corresponds to about 25 m in sea level
- Expect large sea level rise over several centuries (several meters to >20 m)
- Horizontal migration of coasts
- Pollution of inundated coastal areas and waters
- Prepare for loss of coastal cities

## Example Hampton Roads

Today: 5 mm/year  
(~ 50 cm/century)

## Example Hampton Roads

Today: 5 mm/year  
(~ 50 cm/century)

Soon could get as high as:  
20 mm/year (2 m/century)

## Example Hurricane Sandy

Today: 5 mm  
(~ 50 cm/century)

Soon could get as high as:  
20 mm/year (2 m/century)

Local Sea Level Rise leads to:

- more nuisance flooding
- higher risk of extreme floods
- a transient coast line

Example Hurricane Sandy  
Today: 5 mm  
(~ 50 cm/century)

Soon could get as high as:  
20 mm/year (2 m/century)

Local Sea Level Rise leads to:

- more nuisance flooding
- higher risk of extreme floods
- a transient coast line

## Future Sea Level Rise

Question: What is the probability density function for sea level change per century?

Look at paleo-data ...

Scientifically, we cannot exclude a large, rapid global sea level rise with large spatial variability in local sea level rise.

# Sea Level Rise

## Future Sea Level Rise

Question: What is the probability density function for sea level change per century?

Look at paleo-data ...

Scientifically, we cannot exclude a large, rapid global sea level rise with large spatial variability in local sea level rise.

Large sea level variability is a system characteristics, not a new phenomenon, not a problem - just not known to modern civilization

Figure 13.18

Figure 13.19

**Figure 13.18 |** Ensemble mean regional contributions to sea level change (metres) from (a) glacial isostatic adjustment (GIA), (b) glaciers and (c) ice-sheet surface mass balance (SMB). Panels (b) and (c) are based on information available from scenario RCP4.5. All panels represent changes between the periods 1986–2000 and 2081–2100.

**Figure 13.19 |** (a) Ensemble mean regional relative sea level change (m) evaluated from 21 models of the CMIP5 scenario RCP 4.5, including atmospheric loading, plus land-ice, GIA and terrestrial water sources, between 1986–2005 and 2081–2100. Global mean is 0.48 m, with a total range of -1.74 to +0.71 m. (b) The local, lower 90% uncertainty bound ( $p=0.05$ ) for RCP4.5 scenario sea level rise (plus non-scenario components). (c) The local, upper 90% uncertainty bound ( $p=0.95$ ) for RCP4.5 scenario sea level rise (plus non-scenario components). Note that the global mean is different from the value in Table 13.5, by less than 0.01 m, because a slightly different set of CMIP5 models was used (see the Supplementary Material) and that panels (b) and (c) contain local uncertainties not present in global uncertainties.

**Abstract.** There is evidence of ice melt, sea level rise to +5–9 m, and extreme storms in the prior interglacial period that was less than 1 °C warmer than today. Human-made climate forcing is stronger and more rapid than paleo forcings, but much can be learned by combining insights from

# Mainland Miami ponders returning neighborhoods to nature in order to survive rising seas

BY DAVID SMILEY  
[dsmiley@miamiherald.com](mailto:dsmiley@miamiherald.com)

On mainland Miami, miles away from the pumps that keep Biscayne Bay from slowly swallowing South Beach, the neighborhood around Ray Chasser's riverfront house sometimes seems like it's drowning one high tide at a time.

When the moon is full and the bay bloated, a salty soup comes seeping forth from French drains and onto the streets, turning the low-lying peninsula where the southeast corner of Shorecrest meets the mouth of the Little River into a temporary tide pool. During the annual [King Tide](#), when the water level is at its peak, the coastal community floods for days, something Chasser says didn't happen when he first acquired his property 30 years ago.

"As soon as the tide starts coming up, you can see it coming from the drains. And then the streets are covered," he said. "And it's going to get worse."

### Norfolk Coastal Storm Risk Management

#### Background

As a result of [Hurricane Sandy](#) in October 2012, Congress passed [P.L. 113-2](#), a portion of which directed actions USACE was to take, including preparation of two interim reports to Congress, a project performance evaluation report, and a comprehensive study to address the flood risks of vulnerable coastal populations in areas affected by Hurricane Sandy within the boundaries of the North Atlantic Division of the U.S. Army Corps of Engineers.

# Heat Waves

A heat wave is a period of excessively high heat index.

Heat index is a measure of how hot it feels and it depends on temperature and humidity

The 1995 Chicago heat wave was heat wave, which led to 739 heat-related deaths in Chicago over a period of five days.

Article Figures & Data Info & Metrics eLetters PDF

The summer of 2010 was exceptionally warm in eastern Europe and large parts of Russia. We provide evidence that the anomalous 2010 warmth that caused adverse impacts exceeded the amplitude and spatial extent of the previous hottest summer of 2003. "Mega-heatwaves" such as the 2003 and 2010 events broke the 500-year-long seasonal temperature records over approximately 50% of Europe. According to regional multi-model experiments, the probability of a summer experiencing "mega-heatwaves" will increase by a factor of 5 to 10 within the next 40 years. However, the magnitude of the 2010 event was so extreme that despite this increase, the occurrence of an analogue over the same region remains fairly unlikely until the second half of the 21st century.

DESCRIPTION SOURCE MORE INFORMATION

This statistic illustrates deaths due to drought worldwide from 1900 to 2016\*. The dry period of April 1983 in Sudan caused around 150,000 deaths.

### Deaths due to drought worldwide

The 1928 drought in the People's Republic of China was the deadliest drought during the period between 1900 and 2016, causing the death of an estimated three million people. This drought in the Chinese provinces of Henan, Shaanxi and Gansu brought about crop failure and widespread famine. It lasted from 1928 to 1930 and the effects were exacerbated by insufficient or inefficient government relief and

Biological Hazards: Sources of biological hazards may include **bacteria, viruses, insects, plants, birds, animals**, and humans. These sources can cause a variety of health effects ranging from skin irritation and allergies to infections (e.g., tuberculosis, AIDS), cancer and so on.

## Infectious diseases

Figure 6.1: Four main types of transmission cycle for infectious diseases (reference 5)

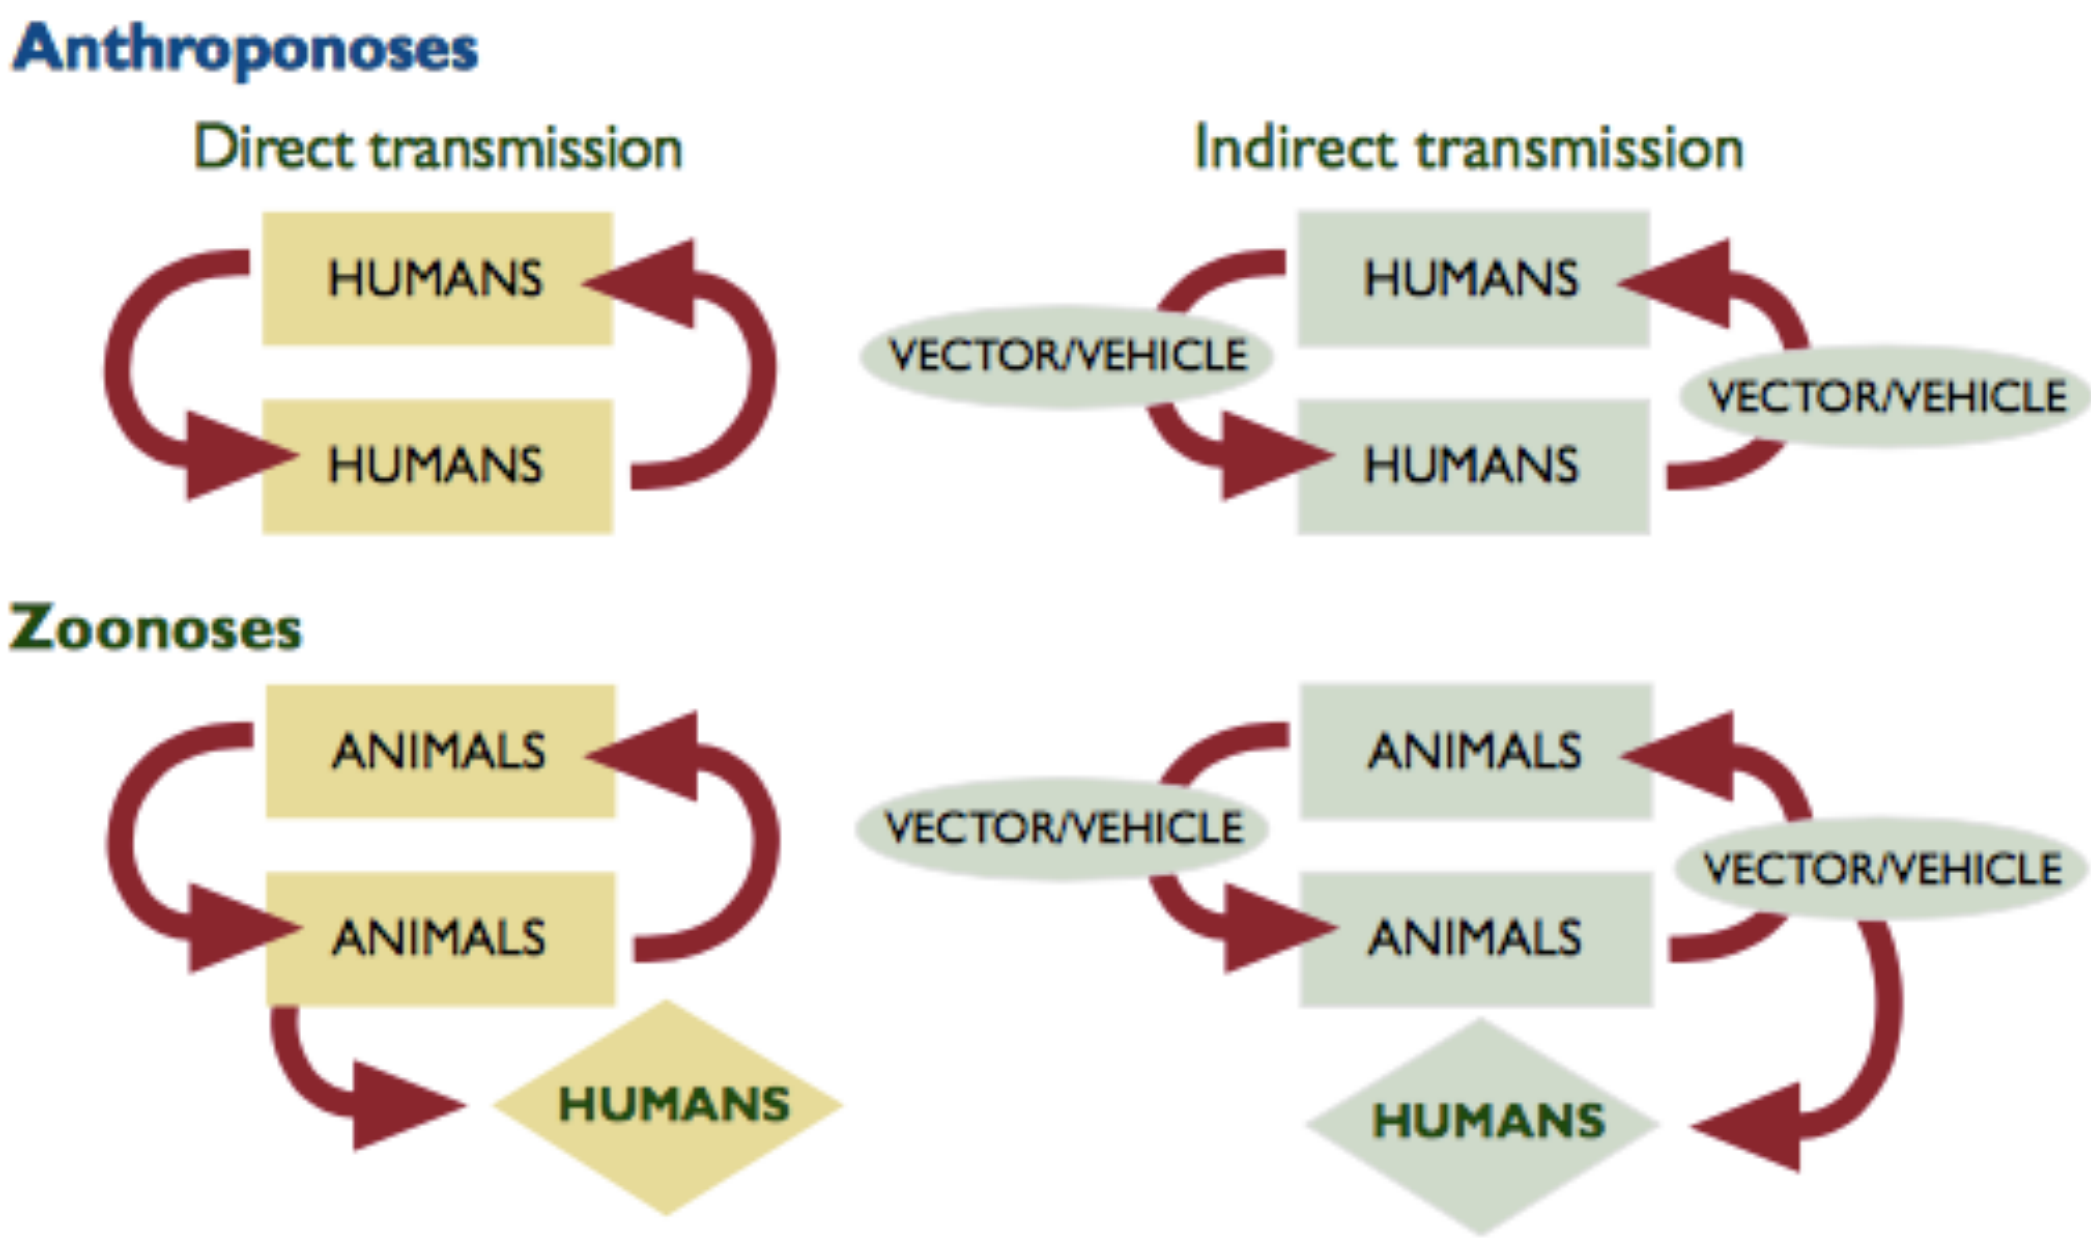

Table 6.1: Examples of how diverse environmental changes affect the occurrence of various infectious diseases in humans (Reference 5)

Environmental changes	Example diseases	Pathway of effect
Dams, canals, irrigation	Schistosomiasis	▲ Snail host habitat, human contact
	Malaria	▲ Breeding sites for mosquitoes
	Helminthiasis	▲ Larval contact due to moist soil
	River blindness	▼ Blackfly breeding, ▼ disease
Agricultural intensification	Malaria	Crop insecticides and ▲ vector resistance
	Venezuelan haemorrhagic fever	▲ rodent abundance, contact
Urbanization, urban crowding	Cholera	▼ sanitation, hygiene; ▲ water contamination
	Dengue	Water-collecting trash, ▲ <i>Aedes aegypti</i> mosquito breeding sites
Deforestation and new habitation	Cutaneous leishmaniasis	▲ proximity, sandfly vectors
	Malaria	▲ Breeding sites and vectors, immigration of susceptible people
	Oropouche	▲ contact, breeding of vectors
	Visceral leishmaniasis	▲ contact with sandfly vectors
Reforestation	Lyme disease	▲ tick hosts, outdoor exposure
Ocean warming	Red tide	▲ Toxic algal blooms
Elevated precipitation	Rift valley fever	▲ Pools for mosquito breeding
	Hantavirus pulmonary syndrome	▲ Rodent food, habitat, abundance

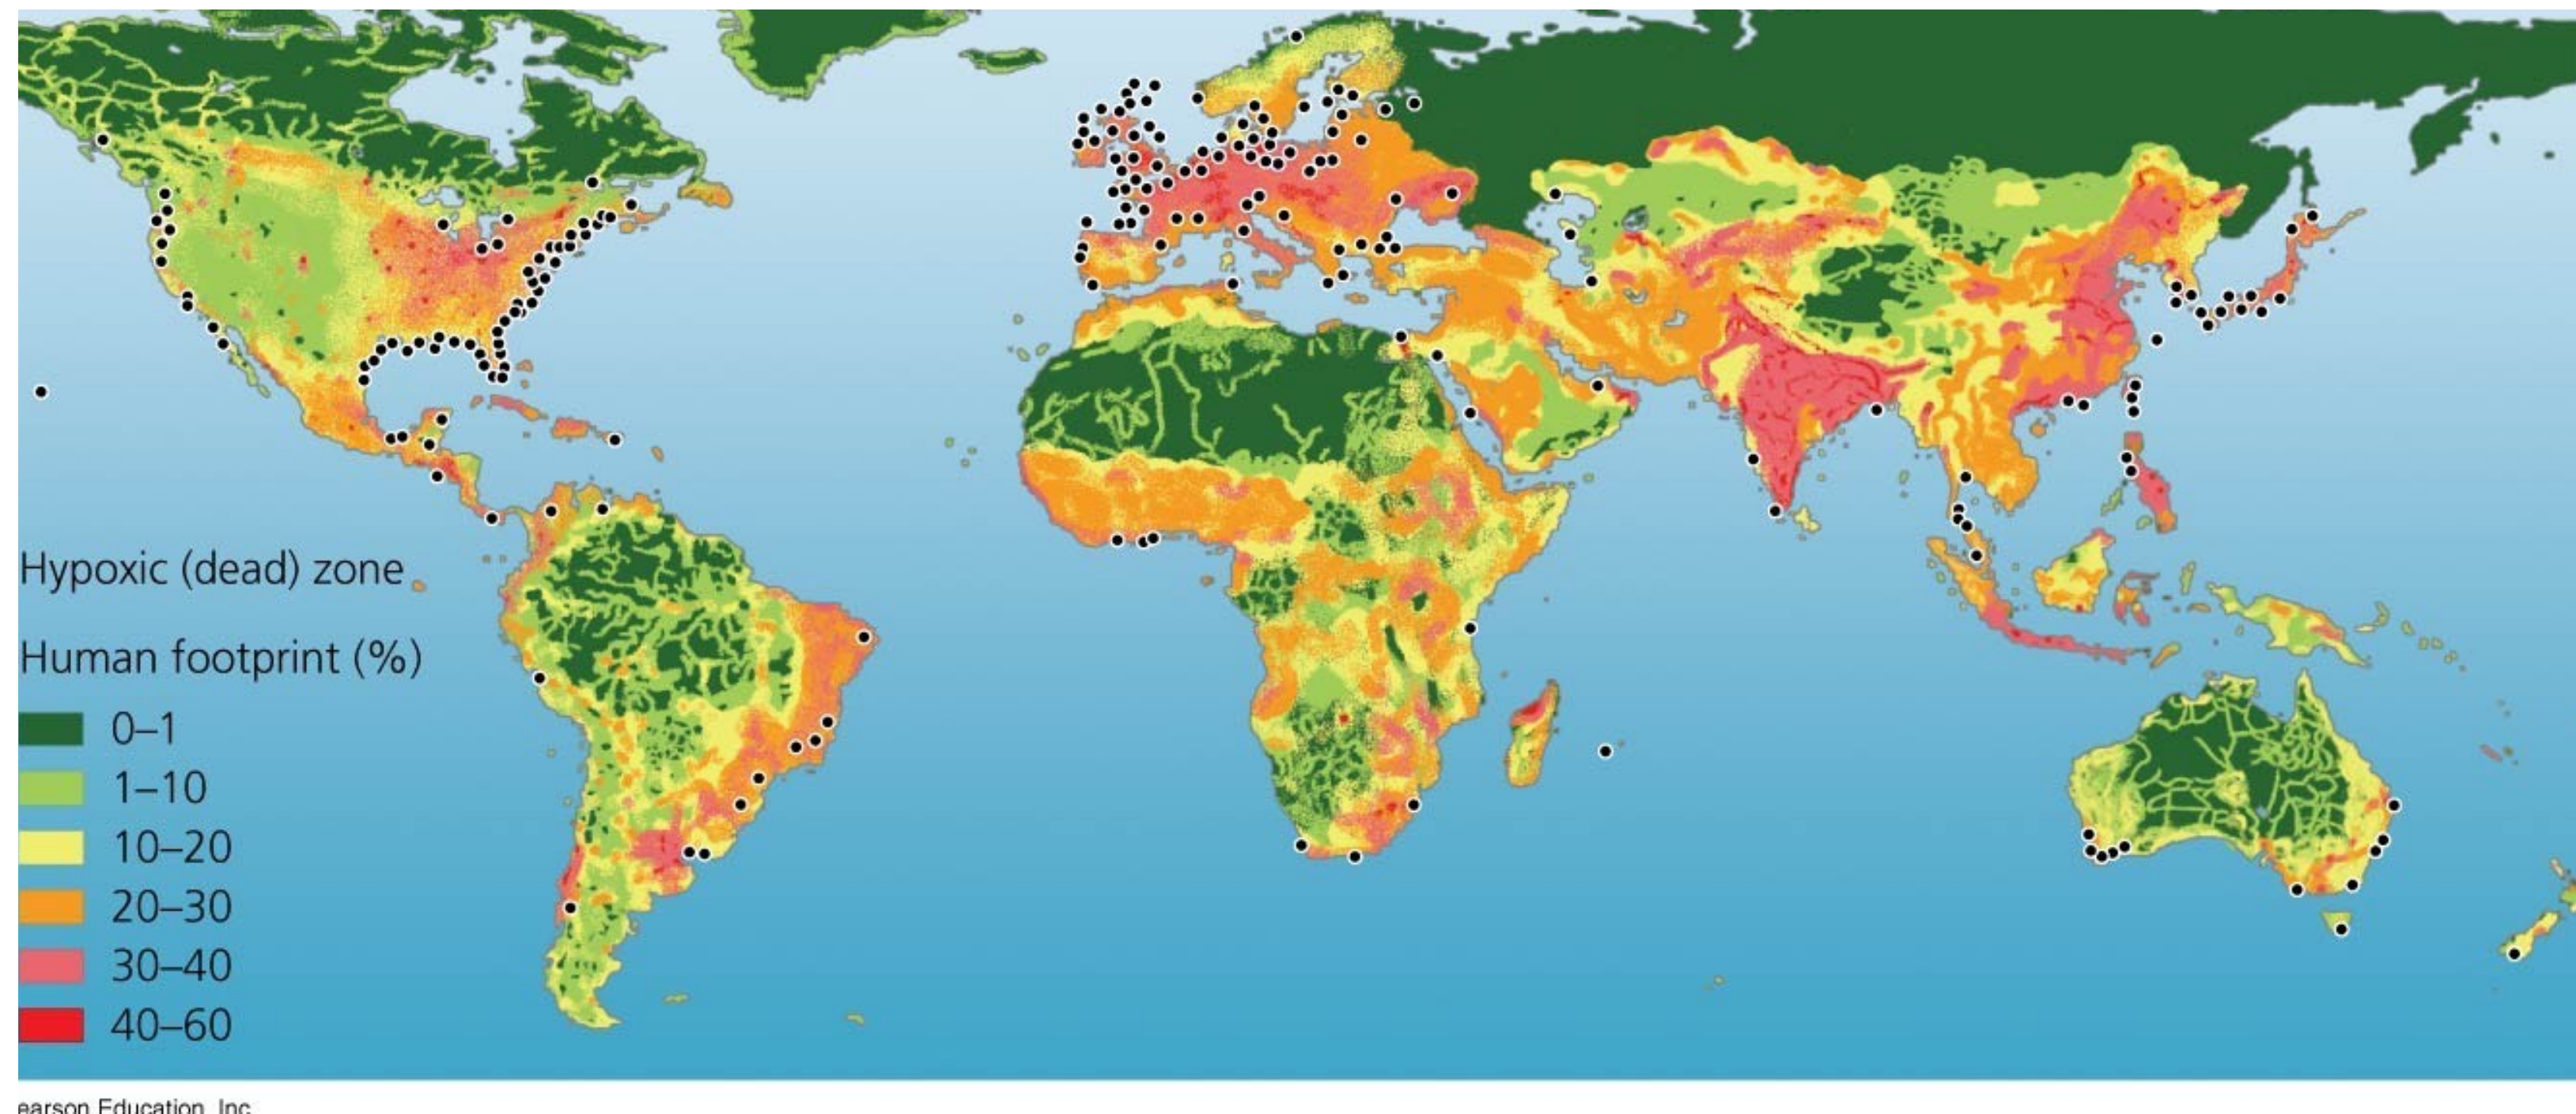

▲ increase ▼ reduction

# Land use, biological hazards, extinction

Biological Hazards: Sources of biological hazards may include **bacteria, viruses, insects, plants, birds, animals**, and humans. These sources can cause a variety of health effects ranging from skin irritation and allergies to infections (e.g., tuberculosis, AIDS), cancer and so on.

## Ecosystem impacts

An invasive species is a plant, fungus, or animal species that is not native to a specific location, which has a tendency to spread to a degree that can cause damage to the non-human and human environment, including human economy and human health.

Forests and Insects: While native insects and diseases contribute to the death of old and stressed trees and lead the way to the regeneration of trees and forests, non-native insects and pathogens can dramatically alter this cycle.

## Extinctions during human era worse than thought

September 2, 2014 Media contact: [David Orenstein](#) 401-863-1862

The gravity of the world's current extinction rate becomes clearer upon knowing what it was before people came along. A new estimate finds that species die off as much as 1,000 times more frequently nowadays than they used to. That's 10 times worse than the old estimate of 100 times.

**PROVIDENCE, R.I.** [Brown University] — It's hard to comprehend how bad the current rate of species extinction around the world has become without knowing what it was before people came along. The newest estimate is that the pre-human rate was 10 times lower than scientists had thought, which means that the current level is 10 times worse.

Extinctions are about 1,000 times more frequent now than in the 60 million years before people came along. The explanation from lead author Jurriaan de Vos, a Brown University postdoctoral researcher, senior author Stuart Pimm, a Duke University professor, and their team appears online in the journal [Conservation Biology](#).

In absolute, albeit rough, terms the paper calculates a “normal background rate” of extinction of 0.1 extinctions per million species per year. That revises the figure of 1 extinction per million species per year that Pimm estimated in prior work in the 1990s. By contrast, the current extinction rate is more on the order of 100 extinctions per million species per year.

### An order of magnitude

A new and more precise recalculation of the normal background extinction rate — what it would be without the human presence — shows the rate to be lower, meaning that the rate of extinction in the human era is as much as 10 times worse than had been thought.

## Mitigation: Reduce flows and growth

- New economy - how new?
- Social and Solidarity Economy; United Nations Research Institute for Sustainable Development (UNRISD)?
- Not enough to think about distribution, have to ask about the purpose of economy.
- Dual purpose economy: creating human wealth while safeguarding the Earth's life-support system.

- Not enough to think about distribution, have to ask about the purpose of economy.
- Dual purpose economy: creating human wealth while safeguarding the Earth's life-support system.

## Adaptation: Prepare for surprises - antifragile

- old paradigms are no longer valid
- overcome normalcy bias
- develop foresight: living on a new planet full of surprises
- understand that humans may not be able to live everywhere on the planet

Action: Transition to an economy “that meet the needs of the present while safeguarding the Earth’s life-support system, on which the welfare of present and future generations depends.”
